

Avinash: Defined and explained the business question in detail and provide the data dictionary. And thorough understanding of each dataset variable's role in predicting heart disease

Rohitha: Focused on dataset and a brief explanation of how this dataset is relevant to the business question of predicting heart disease risk.

Nagarjuna: I was responsible for organizing the data preprocessing steps to make sure our dataset was clean, structured, and ready for analysis. I worked on handling missing values, standardizing variables, and converting categorical data into numerical formats so our machine learning models could perform effectively. I also conducted a literature review on machine learning techniques used for heart disease prediction, summarizing key research findings to help shape our approach. Additionally, I mapped out the process flow for the project, outlining clear steps for model training, evaluation, and interpretation. By structuring everything from data collection to model deployment, I helped ensure that our workflow was efficient, logical, and aligned with best practices.
