

# Project Update #2

## Roles of Group members: (Group-9)

### 1. **Nagarjuna Sreerangapu**

Conducted Exploratory Data Analysis (EDA) by visualizing numerical and categorical variables to identify key patterns related to heart disease. Used histograms and density plots to analyze distributions, boxplots to detect outliers, and correlation heatmaps to examine relationships between numerical features. Additionally, created stacked bar charts to assess the impact of lifestyle factors like Smoking, Alcohol Consumption, and Physical Activity on heart disease risk. These insights helped refine feature selection for predictive modeling.

### 2. **Rohitha Kothapalli**

Focused on data cleaning and dataset understanding, ensuring relevance to heart disease prediction. Tasks included handling missing values, converting data types, and detecting outliers using boxplots.

### 3. **Avinash Ganiseti**

Conducted the literature review and process flow analysis, exploring machine learning techniques for heart disease prediction. Defined the process flow, highlighting steps from data collection to model development and evaluation.
